What Are Our Goals?

Our education system is designed to develop or more of our students' potential. Yet, despite this focus, many children are falling behind in their academic pursuits. This phenomenon is known as the "dollar-gap" and it is contributing to a wider problem: the underachievement of minority students. When we look at the educational achievements of different groups, we see significant disparities. Research shows that minority students, particularly those from lower-income families, are less likely to graduate from high school and are more likely to drop out. This gap is not only a matter of academic performance but also a reflection of broader social and economic inequalities. To address this issue, we need to focus on equitable education and ensure that all students have access to quality education. This requires investment in schools, teacher training, and resources that support diverse learning needs. By doing so, we can help close the gap and provide all students with the opportunity to succeed.
Can Technology Explain Our Many Ways of Knowing?

Copyright © 2000 by Howard Gardner

The new technologies, like television and radio, have provided quick and easy access to information and entertainment, and are available almost everywhere. The old methods of learning, writing, and teaching are less accessible to us today. It is possible to use these new technologies to examine the history and the present. In this essay, I will talk about how television and other media can help us understand the new technologies and the ways in which they can be used to teach and learn. I will also discuss the role of television in education and the impact of new technologies on the classroom and the world of education.
